This handbook covers the stated application version. Internet-based branch linking is under development and is not described here as a service available to purchase or use.

Section 01

How to use this handbook

Read this section before your first session

TapBix helps you manage products, sales, purchases, inventory, customers, suppliers and accounts. It also supports multiple devices and independent branches on a local network.

Choose your starting point

Your role	Start with
Business owner	Setup, permissions, reports, financial management and backups.
Cashier	Customers, checkout, returns, shifts and printing.
Purchasing officer	Suppliers, purchases, purchase returns and consignment.
Warehouse keeper	Locations, stock counts, transfers, receiving and inventory reports.

Before using live business data

1. Check the application version, signed-in account, branch and current location.
2. Practise with separate test data. Keep training transactions out of your live records.
3. Take a backup before importing a large dataset or reconfiguring a device.

Menus can look different on a phone and a computer. This handbook follows section names and working steps, rather than fixed button positions or specific device names.

Section 02

Setting up your business

Welcome screen → Setup

1. **Choose the device function:** standalone device, company master, independent branch server or connected device. To join an existing business, use an administrator's invitation.
2. **Enter company information:** name, contact details, currency and required settings. Check the currency before recording transactions.
3. **Set up the owner account:** use private login credentials, then create a separate account for each employee.
4. **Review sales settings:** taxes, payment methods, printing and stock policy.
5. **Add master data:** categories, products and variants, suppliers and customers.
6. **Record stock:** use a documented opening balance, purchase invoice or consignment receipt, according to its source.
7. **Verify:** open the location balance and movement report to check your entries.

A simple start: a shop with one device can begin with its own products and sales. Add other devices and locations as the business needs them.

Renaming a company or device does not transfer stock or merge databases.

Section 03

Company, branch, sales floor and warehouse

Branches, warehouses and devices

Term	Meaning
Company	The business to which branches and locations belong.
Branch	The operating unit to which documents and accounts are attributed.
Branch sales floor / branch stock	The stock location within the branch. It may display the default location code.
Branch warehouse	An additional location belonging to the branch, with its own stock quantities.
Connected device	A device working through its branch server, within its assigned location and permissions.

Choose the correct location

Before a purchase, sale or stock count, check the branch and stock location. Receive a purchase into the place where the goods actually arrive. Use a transfer if they move later.

The sales floor holds 10 units and the warehouse holds 20. The combined balance is 30 units. Transferring and receiving 5 units from the warehouse into the sales floor leaves 15 units in each.

Creating a warehouse or connecting a device adds no stock. The supplier account belongs to the branch ledger; the receiving location determines where the quantity is held.

Section 04

Navigation, search and document status

Dashboard and menus

1. Open a section from the dashboard or navigation menu. Phones may use cards where computers use a sidebar.
2. Search by document number, name or barcode, as supported by the screen.
3. Check filters before concluding that data is missing: date, branch, warehouse, customer or supplier, and status.
4. Open a document card to inspect its lines, payments and status, then use its available actions.
5. After changing a filter, wait for loading to finish. Refresh when you need the latest reading.

Status	Meaning
Draft	The transaction is incomplete. Review it before saving or posting.
Posted	The document’s effects have been recorded according to its type.
Cancelled / reversed	A cancellation or reversal was recorded. Open its history to see why.
In transit	A transfer has been dispatched and has not yet been fully received.

Available actions depend on account permissions, device function and document status. Check these before creating a replacement transaction.

Section 05

Creating products and categories

Products → Add product

1. Create clear categories, such as “Drinks” or “Clothing”, then open Add product.
2. Enter a recognisable product name, category and required identification details.
3. Enter its product code and barcode where applicable. Use a unique identity for each distinct product.
4. Select the unit of measure, tracking options and variants appropriate to the product.
5. Review selling prices, cost, limits and any other fields shown in the form.
6. Save, then check that searches by name, code and barcode find the product.

Editing or deactivating a product

Open the product and choose Edit. Preserve its identity when it has transaction history; changing a name does not create a new product. Use the available deactivate or archive action for products you no longer use.

Import and export

Use the import template provided by the application. Review column mapping, previews and errors before confirming. Start with a small file, then export the product list for review or storage.

A product record defines an item. Enter quantities through the appropriate inventory documents and avoid repeating stock already recorded.

Section 06

Variants, weight, length and volume

Products → Variants / Unit settings

Products with colours or sizes

1. Create the base product, such as “Shirt”.
2. Add its available attributes, such as colour and size.
3. Create each actual variant, such as “Blue / Medium”, with its code, barcode and price as needed.
4. Select the specific variant on invoices and transfers.

Products sold in fractional quantities

1. Select the unit used by the price, such as kilogram, metre or litre.
2. Enter the quantity in that unit. At a price per kilogram, 0.5 means half a kilogram.
3. Review pack-to-base-unit conversions when using packaging units.
4. Check the quantity and total before saving or returning goods.

At 40 per metre, a sale of 2.5 metres has a line value of 100 before discount and tax.
Enter 2.5 when the selected unit is metres.

Use matching variants and units across purchases, sales, transfers and returns. Check batch and expiry details for products that require tracking.

Section 07

Prices, discounts and taxes

Business settings and invoice screens

Before the first invoice

Review the currency and tax policy, including whether prices include tax or have tax added. Choose the setting used by your business and check the invoice preview.

1. Check each line's unit price and quantity.
2. Select the available discount mode: per item or per invoice.
3. Enter a fixed amount or a percentage as the field requires.
4. Review promotional discounts before adding a manual discount.
5. Check subtotal, discount, tax, total, paid amount and outstanding balance.
6. Save when the final amount matches the agreement with the customer or supplier.

A line worth 100 with a 10% discount becomes 90 after discount. The final tax amount depends on the document's tax and price-inclusion settings.

A linked return uses the original invoice. Do not substitute today's price or tax settings for the values of an earlier transaction.

Section 08

Suppliers and supplier accounts

Suppliers → Add supplier / Supplier details

1. Search for the supplier before creating a new record.
2. Enter the name, contact information and required details.
3. If using an opening balance, enter only a documented amount that predates your use of the system.
4. Assign each purchase invoice and purchase return to the correct supplier.
5. Record actual payments using the appropriate payment action, then review the supplier statement.

Reading a statement

Select the period and branch. Review purchases, returns, payments and adjustments by type. Open the document behind a movement to understand the amount.

Suppliers and branch warehouses

A purchase delivered to a branch warehouse belongs to that branch's ledger, with the warehouse identified as the receiving location. Use the existing supplier record for other locations of the same branch.

Moving goods between company locations does not create another purchase. Supplier identity may remain attached to the goods for source tracking without creating a new liability just for the move.

Section 09

Creating a purchase invoice

Purchases → New invoice

1. **Supplier and location:** select the supplier and check the branch and actual receiving location.
2. **Document details:** check the date, invoice number and available reference. Use the due date for an outstanding amount payable later.
3. **Lines:** search or scan, then select variant, unit, quantity and unit cost.
4. **Tracking:** enter batch and expiry details where required.
5. **Calculation:** review line discounts, invoice discount, tax and available charges.
6. **Payment:** enter the amount paid and method. Check the supplier balance for credit or partly paid purchases.
7. **Confirm:** save, then reopen the saved invoice to check its lines and location.

After saving

Check the increased location stock, supplier movement and payment. Print or share the document using the available actions.

When recorded goods move from the receiving area to the sales floor, use a transfer. Avoid entering the purchase again.

Section 10

Purchase returns and adjustments

Purchases → Purchase returns

When the original invoice is available

1. Open the invoice or start a return linked to it.
2. Select the lines and quantities actually being returned. Check the remaining returnable quantity.
3. Verify the issuing stock location, variant and batch where applicable.
4. Enter the return reason and review the line value, discount and tax being reversed.
5. Select the available financial treatment: a refund received or a supplier balance adjustment, according to the agreement and actual payment.
6. Confirm, then review inventory, the supplier statement and the resulting document.

When no original invoice can be linked

Use an adjustment return only when your permissions allow it. Enter the required source, value and reason. Review this independent document carefully; it does not automatically prove a connection to an earlier invoice.

A return from a branch warehouse affects stock at that location and the supplier account in the branch ledger. Check the direction of money: receiving a supplier refund differs from paying a refund to a customer.

Section 11

Customers, balances and loyalty points

Customers → Customer details

1. Search by name or phone before adding a customer.
2. Enter customer details and check any documented opening balance.
3. Select the customer on the sale so credit, payments and points are attributed correctly.
4. Open the statement to review sales, returns, collections and the outstanding amount.

Using points to pay

1. Select the customer before completing the sale.
2. At checkout, review the available points and their value under your loyalty policy.
3. Enter the points to redeem within the permitted limit, then check the remaining payment and its method.
4. After saving, review the customer balance and points in the transaction or customer account.

A connected device relies on its branch server to confirm the balance. If verification fails, restore the connection or agree on another payment method with the customer.

For credit or partly paid sales, review the customer balance after posting. The invoice total may differ from the money collected.

Section 12

Creating a sale and completing checkout

Sales → New sale

1. **Check the location:** verify the branch and sales floor or warehouse issuing the stock.
2. **Add products:** search or scan, then select variant, quantity and unit.
3. **Select the customer:** this matters for credit, points and statements. Select a salesperson when tracking sales and commissions.
4. **Review pricing:** check discounts, promotions and tax on each line and the invoice.
5. **Check stock sources:** if an owned/consignment or supplier allocation is shown, verify the available source.
6. **Open checkout:** select a payment method and enter money received and any points redeemed.
7. **Confirm once:** wait for the result, then open the saved invoice to print or share it.

Before handing over the goods

Check the invoice number, total, paid amount and remaining balance. Confirm that posting has completed.

If the connection fails after saving, check the invoice list and transaction status before repeating the sale. A connected device needs access to its branch server.

Section 13

Sales returns and cancellation

Sales → Returns / Invoice details

1. Open the original invoice and choose the return action.
2. Select products and quantities within the remaining returnable amount.
3. Record the reason and actual disposition of the goods: return to stock or another available treatment appropriate to their condition.
4. Review refund amount and method. Choose cash, card, account credit or cheque according to available options and the actual transaction.
5. For unsaleable consignment goods, review whether the supplier or business bears responsibility and record the reason.
6. Confirm, then check the customer balance, stock, points and return document.

Returns and cancellation

A return handles goods brought back after a sale. Cancellation or reversal corrects a document according to its status and your permissions while retaining a record of the action. Read the action before confirming.

Repeating a return does not increase the returnable quantity. If an invoice from another branch cannot be verified, wait for verification or use an authorised adjustment procedure with a documented reason.

Section 14

Promotions and promotional discounts

Promotions and discounts

1. Add a promotion and enter a name that explains its purpose and duration.
2. Select a promotion type available in your version.
3. Select eligible products, categories or conditions.
4. Enter the required discount, quantity or reward terms for that type.
5. Review start and end dates, active status and any limits shown in the form.
6. Save, then test both an eligible and an ineligible basket using training data.

During a sale

Review the discount applied before adding a manual discount. Check how changes to quantities, products or the customer affect eligibility.

When a promotion ends

Check its status and dates before changing base prices. A saved document retains its transaction values; an expired promotion does not require editing old invoices.

If a promotion is missing, first check activation, dates, eligible products, quantities and conditions. Understand the cause before substituting a manual discount.

Section 15

Stock balances and movements

Products and inventory reports

Understanding a balance

Select the location, product, variant and unit. Review available, owned, consignment, reserved and in-transit quantities where shown.

1. Open the product balance at the required location.
2. Review recent purchases, sales, returns, transfers and stock counts.
3. Open the source document for any movement that needs explanation.
4. Use valuation reports for stock value and movement reports for quantities and reasons.

Opening stock

Use a documented opening balance for goods held before recording began. Check quantity, unit cost, ownership and location. Move goods already recorded elsewhere using a transfer.

Stock quantity and stock value answer different questions. Consignment quantities may belong to a supplier and should not automatically be treated as business-owned assets.

A sales-floor balance of 10 and a warehouse balance of zero will give different results when those locations are selected on a sale or report.

Section 16

Stock counts, adjustments and batches

Inventory → Count or adjustment / Expiry reports

1. Select the branch and location before starting a count.
2. Select products and variants to count, checking their units.
3. Enter physically counted quantities and review differences from recorded balances.
4. Choose the shortage or surplus reason and review required source, ownership and cost details.
5. Confirm after review, then open the product movement and resulting document.

Batches and expiry

For batch-tracked items, record the batch and expiry on receipt. Review near-expiry and expired-stock reports. Select the correct batch when a transaction requests it.

Explain differences before adjusting

If a difference comes from an incomplete invoice or transfer, resolve that document first. Keep pending movements and stock held at other locations in mind during the count.

Keep the count record and reason. Changing today's product cost does not automatically correct an earlier movement; use the appropriate procedure for that document.

Section 17

Transferring between sales floors and warehouses

Branches, warehouses and devices → Transfers

Source dispatches

Goods in transit

Destination receives

1. Select the **source location** and **destination location**. Read the branch name, location type and code, especially for similar names.
2. Search products and select variants and quantities.
3. Review owned and consignment quantities and supplier/source allocation where available.
4. Choose review and save, then check the summary before dispatch.
5. After dispatch the goods are in transit. Contact the receiving operator if follow-up is needed.

Wrong destination?

Open the outgoing transfer and use “Recall remaining” when available. Check the destination’s status and quantities already received. If receiving has completed, use an appropriate documented return transfer.

An internal transfer does not create a customer sale or a new supplier purchase. Keep one documented stock movement for the transfer.

Section 18

Receiving transfers and tracking progress

Transfers → In progress → Incoming transfer

1. Use the receiving location's device with an account permitted to receive.
2. Open the incoming transfer and check source, destination and lines.
3. Match the physical goods against the document. Enter quantities received in good condition and any damaged or missing quantities and reasons requested by the form.
4. Confirm receipt and wait for confirmation.
5. Check destination stock and transfer status. With partial receiving, the remainder stays open for follow-up.
6. At the source, verify that the receipt and updated status have arrived.

If a transfer is missing

Check connection to the branch server, device and user location assignments, synchronisation and filters, then refresh. Network isolation can prevent communication even when devices appear to use the same network.

Notifications draw attention to a transfer. The saved document and transfer list provide its recorded status. Verify the original operation before entering an alternative receipt.

Section 19

Consignment: agreements and receiving

Consignment management

Consignment goods remain supplier-owned until the treatment specified in the agreement. A product may have both owned and consignment quantities.

1. Open consignment agreements and create one for the correct supplier.
2. Set the supplier entitlement method and available terms, then review covered products and locations.
3. Record a consignment receipt for goods actually received, specifying location, variant and required source.
4. After confirming, review custody quantities and the supplier report.

Loading items from an invoice

Populating lines from a supplier invoice saves data entry. Review the action's effect before confirming; check whether the quantity has already been recorded.

Changing ownership of existing stock

Use the available conversion of existing stock to consignment when its conditions apply. A new receipt would add more quantity.

Keep the agreement reference. A product name containing “consignment” does not define ownership; the stock source and agreement do.

Section 20

Consignment: sales, returns and settlement

Consignment management → Agreement and reports

1. During a sale, review owned/consignment allocation and supplier terms.
2. Review consignment sales and entitlements before creating a settlement.
3. Create the settlement for the required period or movements using the options provided.
4. Check the amount due to the supplier, then record the actual payment and method.
5. Open reconciliation to check stock, custody, settlements and payments.

Returning custody stock and recording damage

Use a custody return document for goods sent back to the supplier. For damaged or missing stock, record quantity, reason and responsibility under the agreement using the available action.

Customer returns

Link to the original sale when available. Review the quantity's return to its source and the adjustment to supplier entitlement, particularly if the sale was already settled.

Check the agreement and settlement before creating a purchase or supplier payment to resolve a consignment issue. Use the document that represents the actual event.

Section 21

Expenses, collections and payments

Expenses and customer/supplier details

Recording an expense

1. Add an expense and choose its date, category or account.
2. Enter amount, a clear description and supporting document reference where available.
3. Select payment method or the required cash/bank account.
4. Review, save and check the expense report.

Collecting from a customer or paying a supplier

1. Open the correct account and review the amount due.
2. Choose payment or collection and enter amount, date and method.
3. Check invoice allocation where the action supports it.
4. Save, then check the statement and cash or bank balance.

A customer pays 200 against a 500 invoice, leaving 300 due. When the remaining 300 arrives, record a collection against the account.

A payment already included in an invoice should not be recorded again as a separate expense or collection for the same event.

Section 22

Cheques and due dates

Financial management → Cheque management

1. Select an incoming or outgoing cheque according to its direction.
2. Enter customer or supplier, amount, cheque number, bank, issue date and due date as required.
3. Review status and save.
4. Follow the cheque through actual clearing or payment, then use the appropriate status action.
5. For a bounced or cancelled cheque, use the designated action and record the reason.

Daily follow-up

Review due and overdue cheques and any partial payments. Match cleared receipts and payments to actual bank movements.

Issuing or receiving a cheque does not always move the bank balance immediately. Check its status and journal entry before adding any further cash movement.

Purchase due dates

Due dates help track amounts payable later to suppliers. Enter the agreed date and review outstanding payments. A due date alone does not mean an invoice has been paid.

Section 23

Accounts, journals and periods

Financial management

Section	Purpose
Chart of accounts	View account types and manage accounts within your permissions.
Journal entries	Review entries and sources; create authorised manual entries.
General ledger	Follow an account's movements for a period.
Trial balance	Review debit and credit balances.
Accounting periods	Manage and close periods after review.

Before posting a manual entry

Check whether an invoice, payment or transfer already posted the event. Select accounts, amounts, date and description, then verify equal debits and credits.

Before closing a period

1. Review invoices, returns, payments and expenses.
2. Review stock counts, pending transfers and reconciliation.
3. Take a backup and review the period's reports.
4. Use an authorised account to close after resolving reported blockers.

Correct the source document when it caused the error. Consult the responsible accountant before approving unusual financial adjustments.

Section 24

Owner equity and fixed assets

Financial management → Owner equity and assets

Owner transactions

1. Open capital and owner equity and add a transaction.
2. Choose capital contribution, drawings, loan received from the owner or loan repayment according to the actual event.
3. Select cash or bank, amount, date and description.
4. Review the journal preview, save and check the balance.

Fixed assets

1. Open fixed assets and depreciation and add the asset.
2. Enter name, category, cost and funding source.
3. Enter acquisition and in-service dates, useful life and residual value as required.
4. Review and save, then track depreciation from the asset record.
5. Use post-depreciation or reverse-last-instalment actions when applicable and permitted.

Equipment used by the business differs from merchandise held for sale. Avoid recording the same value as both inventory and a fixed asset.

Section 25

Reconciliation and investigating differences

Financial management → Reconciliation and health

1. Run the checks and read each result.
2. If inventory and ledger values differ, identify the location, period and amounts involved.
3. Review related opening balances, purchases, returns, transfers and adjustments.
4. Open the source documents and check their completion and status.
5. Take a backup before any treatment that changes the books.
6. After a documented correction, repeat the checks and keep the report.

Reporting a problem

Prepare the application version, device type and function, branch, location, document number and steps leading to the message. Hide sensitive data before sharing a screenshot.

Equal debits and credits alone do not prove inventory reconciliation. Identify the source of a difference before posting a correction.

Section 26

Employees, salespeople and commissions

Employees / Salespeople and commission reports

1. Add the employee and information needed for work.
2. Link their login to the correct employee when setting up the user account.
3. Review the commission policy or available salesperson settings.
4. On a sale, select a salesperson for the whole invoice or each item according to the working mode.
5. Review the period's commission report and open the underlying sales and returns.

Reviewing commission

Check salesperson, date, branch and product, including discounts, returns and cancellations. Review the actual commission basis; total sales may use a different basis.

User accounts and employees

A user account controls login and permissions. Linking it to an employee helps attribute operations to the person performing them. Give each person a separate account.

Keep the owner account private. Managing accounts requires different permissions from selecting a salesperson on an invoice.

Section 27

Users, permissions and location scope

Users and permissions → Add user

1. Enter the username and login details.
2. Select an available role, such as manager, accountant, cashier, salesperson or warehouse keeper.
3. Review the role's permissions and permitted adjustments.
4. Select the branch, location or warehouses the account may access.
5. Link an active employee where the role requires it.
6. Save and reopen the user details to verify role and location.
7. Test login from a device assigned to that location and review available sections and actions.

Device function and user role

A device invitation assigns its function and location. The user account controls permitted actions within that location. Renaming a device grants no additional permissions.

Deactivating an account

Use the user's action menu to edit, deactivate or delete where the record allows it. Preserve transaction history when correcting a role.

If login fails, check credentials, account status, branch server and location assignment before creating a duplicate account.

Section 28

Cashier shifts and end-of-day review

Cashier shifts

1. Open the shift using the responsible account and enter the required opening cash.
2. Perform sales, returns and payments using the correct account.
3. Record additional cash movements through the available action with a clear reason.
4. At closing, count actual cash and review other payment methods.
5. Compare actual and expected amounts and explain differences.
6. Confirm shift closure and print or save the shift report where available.

End-of-day checks

- Unconfirmed invoices and unfinished drafts.
- The day's returns and payments.
- Dispatched transfers awaiting receipt.
- Branch synchronisation and backup status.

Closing a shift concerns cashier activity. Closing an accounting period is a separate action after financial review.

Section 29

Connecting devices within a branch

Devices and network / Device setup before login

1. Choose the device holding the branch database. Keep it available while staff work.
2. Start the company master or branch-server service as configured.
3. In device and invitation management, select the new device's function and location.
4. Create a valid invitation, then enter it in connection setup on the new device.
5. Use local discovery, or enter the address and port if discovery is unavailable.
6. Check company, branch, location and suggested name before completing pairing.
7. Sign in with an employee account authorised for that location and test search and stock viewing.

Cashier and warehouse devices

Both work through their branch server. The invitation assigns the location; account permissions determine available operations. Connected devices need access to that server.

Use pairing rather than copying the database file. Preserve pairing details and check network problems before reconfiguring a disconnected device.

Section 30

Creating an independent branch and warehouses

Branches, warehouses and devices → Company branches

1. On the administration device, create the branch with a clear name and code.
2. Review its default stock location. Add a warehouse for a separate physical stock location.
3. Set the branch assortment: all company products or a managed selection suited to its activity.
4. Create an independent branch-server invitation and enter it on the intended device.
5. Verify setup completion, branch, locations and catalogue before recording transactions.
6. Connect staff devices to that branch server and assign locations and permissions.
7. Record opening stock using purchases, consignment receipts or documented transfers according to source.

Branches with different activities

A clothing branch may need a different assortment from a pharmacy. Use managed assortments, categories and appropriate exceptions while preserving product identities.

Creating a branch does not copy the main branch's stock into it. The company master handles central administration; the branch server runs its own branch.

Section 31

Monitoring branches and connection status

Branches, warehouses and devices → Branch monitoring centre

1. Open the centre from the administration device with an authorised account.
2. Check connected branches and last synchronisation before relying on totals.
3. Select branch, location, document type and period as needed.
4. Open a document to inspect lines, quantities, values and status.
5. Use available print or share actions.

Reading connection status

“Connected” indicates recent contact as observed by the application. “Disconnected” does not mean the data was deleted; the centre may still display the last data received.

Monitoring and reports

The monitoring centre focuses on branch status and documents. Reports calculate the selected report using its filters. Choose the section that answers your question.

A branch document shown centrally does not create a second journal entry in the company master’s ledger. Restore synchronisation when data is late.

Section 32

Reports: location, period and consolidation

Reports / Branch and warehouse reports

1. **Choose scope:** a single location, a branch or the whole company, using the options shown.
2. **Select a report:** sales, purchases, inventory, accounts or a customer/supplier report.
3. **Choose period:** today, week, month, a custom range or all periods.
4. **Set filters:** supplier, customer, category, product or salesperson where available.
5. **Read the summary:** document count, gross amount, returns and net amount. Check whether amounts include tax.
6. **Open details:** inspect documents and their lines to explain the total.
7. **Export or print:** after checking scope and data freshness.

For purchases from one supplier in one branch, select that branch and supplier. Choose “Whole company” for combined branches. Select a specific location for a warehouse-level review.

Check the last synchronisation for remote branches. Central reports remain incomplete while documents are awaiting synchronisation.

Section 33

Choosing the right report

Report list

Your question	Start with
What were sales and the net amount after returns?	Sales, invoice and return reports.
What did we buy from this supplier?	Purchases by supplier and document details.
What is owed to or by this customer or supplier?	The account statement, including payments and returns.
Where is stock and why did its quantity change?	Stock balances, product movements and transfers.
What is the value of remaining goods?	Inventory valuation with the correct scope.
Which products need attention?	Low-stock and expiry reports.
What is due to a consignment supplier?	Consignment reconciliation, settlements and payments.
What are the financial results?	Profit and loss, balance sheet and trial balance.

Purchase reports describe purchasing, supplier statements describe the account and stock valuation describes remaining goods. Different totals can be valid because each report answers a different question.

Section 34

Printing, sharing and barcodes

Document or report details → Print / Share

1. Open the saved document or set the report filters.
2. Select the available print or share icon.
3. Check the preview: company details, document number, customer/supplier, lines, currency and total.
4. Choose printer and paper size, or save as PDF where the print dialog allows.
5. For sharing, choose the destination application or folder and verify the resulting file.

Product labels

From barcode or product functions, choose the product or variant and required label fields. Test one label with your scanner before printing a large batch.

If output is unclear

Check paper size, orientation, scaling and printer settings. A computer may need an operating-system printer driver; a phone needs a connection supported by both the printer and the application.

Check the recipient before sharing files containing customer or supplier information or internal prices.

Section 35

Backups, restore and updates

Settings → Backup and restore

Creating a backup

1. Identify the device holding the branch database. Back up that server's data.
2. Open backup and choose create and save.
3. Wait for confirmation and keep the file in another trusted location accessible if the device fails.
4. Record branch and backup date, and keep anything required to open the protected backup.

Restoring

1. Back up the current state before restoring.
2. Choose the correct branch file and read the operation's effect before confirming.
3. Follow the restore or branch-server replacement workflow where networking is involved.
4. Verify products, documents, accounts and synchronisation afterwards.

Before updating

Take a backup, resolve uncertain transactions and update connected devices to compatible versions. Allow time to verify operation afterwards.

Run one independent server for each branch database. Before restoring an older backup, review any newer data it would replace.

Section 36

Settings and subscriptions

Settings / Subscription

Display and business settings

Choose your language and theme. Review company details, printing, currencies, taxes, inventory policy and loyalty settings in the sections available to your account.

Purchasing and restoring a subscription

1. Open subscriptions and review the plan, features and store price.
2. Complete the purchase with the correct store account and wait for the subscription status to update.
3. If a previous purchase is missing, use Restore purchases and check the account and connection.
4. Use the store's subscription management to change renewal or cancel according to that purchase channel.

Scope of this handbook

This edition covers local operation and branch/warehouse linking on a local network, subject to Pro entitlement and user permissions. Internet-based branch linking is a separate service under development in this edition.

Local branch operation still follows licence verification policy. Check subscription or connection messages and verify an existing purchase before buying the same plan again.

Section 37

Troubleshooting

Start with the symptom

Problem	First check
Connected device cannot reach its server	Branch-server service, address, port and guest-network isolation; run the connection test.
Invitation does not work	Expiry and intended location. Create another invitation if expired.
Employee login rejected	Credentials, account status, role and branch/location scope.
Product missing	Search, variant, active status, assortment and location.
Incoming transfer missing	Destination, filters, permissions and synchronisation; refresh the list.
Report incomplete or unexpectedly combined	Location/whole-company scope, period, supplier/customer and last synchronisation.
Save awaiting verification	Check the original document before repeating.
Account or inventory difference	Reconciliation, movements and source documents; back up before corrections.
Paid feature unavailable	Subscription status, store account, restore purchases and user permissions.

For support, provide a description, steps, application version and error message. Keep passwords, invitation codes and business databases private.

Section 38

Daily checklist and worked example

Use this section for staff training

Start of day

- Check branch-server availability, connection, account and current location.
- Open a shift if required and review stock and due-date alerts.

One complete stock cycle

1. Purchase 20 units into the branch warehouse, recording supplier, cost and payment method.
2. Transfer and receive 5 units into the sales floor. Warehouse stock becomes 15 and sales-floor stock 5.
3. Sell 2 units from the sales floor to the correct customer. Sales-floor stock becomes 3.
4. If the customer returns 1 saleable unit, create a linked sales return with return to stock. Sales-floor stock becomes 4.
5. Review product movements, supplier and customer statements, and sales and return reports.

End of day

- Review pending transactions, transfers, returns and payments.
- Reconcile cash and the shift, then check the last synchronisation.
- Create and store a backup in the approved location.

Run this exercise with training data and keep unrelated factors disabled. Add taxes, discounts and consignment as separate training cases later.
